## About the Workshop

Micromachining refers to techniques for fabrication of 3D structures on the micrometer scale. The ever-increasing demand for smaller and more precise products has fuelled continuous developments in micro-machining technologies. Global competition has driven improvements in the accuracy of manufactured parts as well as the requirement for high productivity and reduced costs. Typical micro products include micro-reactors, MEMS devices, micro medical components, home appliances, telecommunication devices, electronic devices, automotive, aerospace components, micro-channels, heat-exchangers, micro-reactors, micro-scale fuel cells, micro-holes for fiber optics, micro-nozzles for high-temperature jets and many more. Application of micro-product in various industries is increased in the last decade and this demand will also increase in the coming years.

The understanding of the basic mechanism such as heat and mass transport with associated fluid flow including metallurgical transformation, distortion and residual stress generation in different micro-machining is the focus of this course. Understanding the complex interaction not only helps to develop mathematical model, it makes the foundation for analysis, numerical simulation at different scale and experimentation for different types of manufacturing processes. The development of computational models for a manufacturing process relies on mathematical expression of the governing mechanism. It helps to design relevant experiments and drives to find the data to be obtained. Mutual understanding between analytical/numerical and experimental results leads to better insight of the basic manufacturing processes that impact on the improvement of existing process and directs for the development of new process. This course emphasized on the understanding of the most general to advanced manufacturing processes based on scientific principle. The complex mechanism is presented in a simplified way to understand the subject at elementary level. The broad impact is that the students will be able to develop physics based computational model of manufacturing process using various methods.

This workshop aims to give a brief overview of how various modeling approaches helps to analyze Micro and Nano manufacturing process performance along with precision measurement techniques. This workshop will provide a platform to discuss the current research activities across the globe in this field.
